# 10. RISK CHARACTERISATION RELATED TO COMBINED EXPOSURE

## 10.1. Human health

### 10.1.1. Workers

### 10.1.2. Consumer

## 10.2. Environment (combined for all emission sources)

### 10.2.1. All uses (regional scale)

#### 10.2.1.1. Total releases

The total releases to the environment from all the exposure scenarios covered are presented in the table below. This is the sum of the releases to the environments from all exposure scenarios addressed.

Where there is more than one contributing scenario for the environment for a given exposure scenario, the highest release per route across all the contributing scenarios within the use has been taken into account as the release for the use (both for the regional and the exposure due to all the widespread uses). This may lead to overestimation of the PEC.

**Table 10.1. Total releases to the environment per year from all life cycle stages**

Release route	Total releases per year
Water	2.7E4 kg/year
Air	2.81E4 kg/year
Soil	2.05E3 kg/year

#### 10.2.2. Regional assessment

The regional predicted environmental concentration (PEC regional) and the related risk characterisation ratios when a PNEC is available are presented in the table below. The exposure to man via the environment from regional exposure and the related risk characterisation ratios are also provided (when relevant). The exposure concentration for human via inhalation is equal to the PEC air.

The exposure estimates have been obtained with EUSES 2.1.2 unless stated otherwise.
